Dear Anish:

I saw your patient, Dilip Singh, in the Cardiology office today and he seems to be doing very well from a cardiovascular perspective. Apparently he has had guaiac positive stools and has undergone a colonoscopy with the identification of four polyps. Three have been removed and he then had a GI bleed. This has been reevaluated and he has been stable. The fourth polyp will need to be removed at a later time. At this point, his aspirin has been discontinued for a number of days and the Lopid was also discontinued apparently because of increased liver function tests. His current medications therefore include Lasix 40 mg per day, Metoprolol 25 mg qd, Nifedipine XL 30 mg qd. He is aware of a belching and burping sensation after eating but otherwise no exertional or other related symptoms. He is reasonably active but somewhat limited by his claudication.

On exam today, he is comfortable with a blood pressure of 130/70, a heart rate of 65 and regular. Head and neck were unremarkable. Chest is clear. Cardiac exam showed no jugular venous distension at 30 degrees. PMI is normal. S1 and S2 are normal with a physiologic split. There is an S4 and a I/VI systolic ejection murmur at the left sternal border. Abdominal exam was unremarkable. Extremities showed no edema or cyanosis.

His resting 12-lead electrocardiogram demonstrates normal sinus rhythm with left axis deviation and a nonspecific left intraventricular conduction delay.

Anish Sisodiya, M.D.

I think Mr. Singh is basically doing quite well. It would be of

value to repeat an exercise test since he has not had one since 2069. He had minimal ischemia at that time. There are no symptoms that would prompt cardiac catheterization at this point and we will see how he does on the exercise test with the objective findings.

If any problems develop, please don't hesitate to contact me.
Thank you very much for allowing me to help with his care.

Kindest personal regards.

Sincerely yours, Amit Sharma, M.D.
